

GOVERNMENT OF MAHARASHTRA
REPORT ON POOLING OF CENTRAL AND STATE
SAMPLE DATA
66th ROUND OF NATIONAL SAMPLE SURVEY
(JULY, 2009 – JUNE, 2010)

HOUSEHOLD CONSUMER EXPENDITURE (TYPE 1 & 2) &
EMPLOYMENT & UNEMPLOYMENT

Directorate of Economics and Statistics, Planning Department,
Government of Maharashtra,
Mumbai

PREFACE

The Directorate of Economics and Statistics has prepared a report on 'Household Consumer Expenditure' and 'Employment & Unemployment' based on the data of state, central & pooled (central & state) samples collected in the 66th round (July, 2009 – June, 2010) of National Sample Survey.

2. The report contains important findings of the survey in 'Executive Summary' while detailed results are given in 'Survey Findings'.

3. I hope the results of this survey will be useful to senior officers of the Government involved in policy framing, researchers, economists and academicians.

Chapter – 1

EXECUTIVE SUMMARY

Findings

1. The average household size at the state level for the rural and urban areas based on the state and central sample are consistent with each other. This in turn gives similar estimate at the state level on the basis of pooled data. The district wise pooled estimates indicate that in rural areas Hingoli, Parbhani, Nashik, Bid have the largest (5.2 each) average household size while Ratnagiri, Raigad have the smallest (3.8) average household size. In urban areas Ratnagiri has smallest (3.5) and Bid, Parbhani have highest (5.7 each) average household size. (Refer table 6.3)
2. As per pooled data, in rural areas Raigad has the highest Monthly per capita expenditure (MPCE) and Nandurbar has lowest MPCE, while in urban areas Mumbai has highest and Washim has lowest MPCE.
3. As per the State sample data, out of the 33 districts, for rural areas, 17 districts have their MPCE below the State average while as per the central sample data this count is 15 districts.
4. For urban areas, all the districts, except four districts viz. Thane, Mumbai, Raigad and Ratnagiri, have their MPCE below the State average as per the State sample data. However, the central sample data shows that except four districts viz. Thane, Mumbai, Raigad and Pune, all other districts have less MPCE compared to the State average.
5. District wise pooled data of sex ratio shows that, in rural area, Chandrapur has highest and Jalgaon has lowest sex ratio while for urban area, Sangli has highest and Latur has lowest sex ratio.
6. As per State sample data, in rural areas, 18 districts and in urban areas 10 districts have the labour participation Rate (LFPR) above state average. While as per central sample data this count is 16 and 8 for rural and urban areas respectively.
7. LFPR for rural areas is comparatively higher than urban areas for both central and state sample.
8. Relative standard error (RSE) for LFPR (ps+ss, cws, cds) is below 1% for rural area.

Limitations of the data

After pooling of the two samples, the districts Sindhudurg, Hingoli, Parbhani, Akola, Washim, Wardha, Bhandara and Gadchiroli are found to have less number of First Stage Units i.e. FSUs (only 16 villages) in the rural areas while Ratnagiri, Sindhudurg, Nandurbar, Hingoli, Osmanabad, Washim, Bhandara, Gondiya and Gadchiroli districts have less number of FSUs (less than 20 UFS blocks) in the urban areas. These are limiting factors for estimation of district level estimates.

Chapter – 2

Introduction and Background

Background

The National Sample Survey Office (NSSO) conducts nationwide household consumer expenditure surveys at regular intervals as part of its “rounds”, each round normally of a year’s duration. The NSS surveys are conducted through interviews of a random sample of households selected through a scientific design and cover practically the entire geographical area of the country.

The household consumer expenditure survey (CES) is generally covered as one of the main subjects of the NSS survey at quinquennial intervals. This provides a series of CES’s. The 66th round survey (July 2009 - June 2010) was the eighth such survey of this quinquennial series, the seventh having been conducted during the 61st round (July 2004 - June 2005).

State’s participation in NSS surveys

Maharashtra state has been participating in the NSS surveys from 9th round onwards by using the same concepts, definitions and procedures and by adopting the same sample design based on independently drawn sample as that of NSSO called as the State samples. The sample size of the State sample in Maharashtra for rural area is equal to that of Central sample and for urban sample it is one and half times of the Central sample. The sample list of the State sample is drawn and supplied by the NSSO. District wise sample size of 66th round is given in Annexure-1.

One of the objectives of states participation in the NSS programme is to provide a mechanism by which sample size will be increased and the pooling of the two sets of data would enable better estimates at lower sub state level, particularly at district level. At the State level, this will result in increased precision of the estimates and at disaggregated level, estimates will be more stable. But the major benefit will be derived in the case of estimates are generated at sub-state level like NSS regions/districts.

Emerging need for pooling of Central and State samples

The 73rd and 74th constitutional amendment (1992) has brought into existence the democratically elected grassroots institutions of local self governance, with respective delegated functions, both in rural and urban areas. This has enhanced the demand for local level statistics and necessitated requirement of developing basic capabilities at grass root levels to organize such statistics in a harmonious manner. In this context, it is envisioned that the survey resources in overall NSS programme both by Central and State Agencies can be more effectively utilized to generate lower level estimates of key indicators at district level. 13th Finance Commission, in Para 12.99 of its report, noted that “Comparable estimates of district income are extremely relevant for measuring intra-state income disparities. This will enable State Governments to effectively plan policy and programme interventions. They could also be used as a parameter for horizontal distribution of fiscal transfers”. The Commission also recommended for granting finance to State Governments, which

should be utilized by them for strengthening statistical infrastructure at the district level. These requirements are subsequently brought in institutional framework in the implementation of the 13th Finance Commission.

National Statistical Commission's (NSC) Recommendation

The National Statistical Commission in its reports has observed the importance of pooling in the statement:

“The statistical agencies of different State governments have been participating in the NSS programme and canvassing the same questionnaires in matched samples of households in their respective States following identical concepts, definitions and procedures. Results from the central samples and state sample(s) have occasionally been compared. The main purpose of the programme is to pool the two samples and obtain dependable estimates for regions within the States.”

National Statistical Commission (NSC) constituted the committee on pooling of Central and State samples in National Sample Surveys (NSS) etc under the chairmanship of Prof. R. Radhakrishna vide order no. 8(64)/2010-NSC, 30th July, 2010. The terms of reference of the committee are as follows:-

- *Conditions to be fulfilled for pooling of Central and State Sample NSS data*
- *Methodology for pooling*
- *Time frame by which the exercise needs to be completed by each State*
- *Generating weighting diagrams from the pooled data at sub-state level for the purpose of consumer price indices (Rural and Urban) including occupation specific indices such as CPIAL, CPIIW etc., from the NSS data on consumer expenditure surveys (quinquennial & thin sample)*

Assistance of NSSO (DPD) for processing of NSS State Sample Data

Since NSSO develops its own in-house software for processing the Central sample data, in the deliberations of COCSSO held in the recent past, it was recommended that NSSO should assist the States in terms of providing common Data Entry Software, Tabulation Software, Instructions Manual and Training and Hands on Practice to DES personnel. NSSO has already started providing this assistance to States.

The harmonization of data processing process is one of the key essences for pooling the different sets of data. The state sample data should be processed using the same set of validation rules as in the case of Central sample data. Accordingly, it is essential that the State sample data is processed, ensuring the use of same data entry layout as in the case of Central sample. If the States are evolving their own data layout, as per their convenience, then the state data should be put in the layout, harmonized of that with the Central data for using the same software developed for Central samples.

For Maharashtra state the data entry software, validation software and tabulation software are developed by Directorate of Economics and Statistics using Oracle, Java and SAS software. For pooling purpose, state data is put in same layouts as that of Central data.

Parameters considered for pooling:

Considering the smaller sample size at district level following broad parameters were considered for pooling.

- a) MPCE of FOOD, Non-FOOD, and Total MPCE derived from detail item for URP, MRP and MMRP
- b) Household size, sex
- c) Activity status principal, subsidiary, weekly, daily and their intensity

Methodology of pooling:

Two alternate methods are used in pooling the Central and State sample data.

- a) **Weighting by Matching ratio:** Building aggregate estimate of pooled sample in proportion matching ratio m:n of Central and State sample aggregate estimate where m and n are the allotted sample for Central and State sample separately for rural and urban sector. Building ratio estimate of pooled sample as ratio of aggregate estimates.
- b) **Weighting by inverse of variance:** Ratio estimates are built by weighting the ratio estimate of Central and State sample in proportion to inverse of variance of ratio of the Central and State sample.

Tables generated

1. Following Tables were generated for testing the poolability of State and Central samples;

- a) District wise results of run test of MPCE (URP, MRP, MMRP) for pooled sample of rural and urban sectors.
- b) District wise results of chi-square test of persons over worker, unemployed and out of labour force for pooled sample of rural and urban sectors.

2. Following Tables were generated pertaining to the estimation of different parameters and their RSEs;

- a) District wise estimated number of households and their RSEs for Central, State and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors for schedule type-I and schedule type-II
- b) District wise estimated number of persons and their RSEs for Central, State and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors for schedule type-I and schedule type-II
- c) District wise estimated sex ratio and their RSEs for Central, State and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors for schedule type-I and schedule type-II

- d) District wise estimate of MPCE (URP, MRP, and MMRP) for food, non-food and total for Central, State and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors.
- e) District wise RSE of estimate of MPCE (URP, MRP, and MMRP) for food, non-food and total for Central, State and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors.
- f) District wise WPR per 1000(PS+SS) of male, female and total persons for central, state and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors.
- g) District wise RSE of WPR per 1000(PS+SS) of male, female and total persons for central, state and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors.
- h) District wise LFPR per 1000(PS+SS, CWS, CDS) for Central, state and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors.
- i) District wise RSE of LFPR per 1000(PS+SS, CWS, CDS) for central, state and pooled samples (Matching ratio & Inverse variance methods) for rural and urban sectors.

Sample Size of Maharashtra

The sample size of Central and State samples for Maharashtra state is given below;

Chapter – 3

Summary Findings

Run test (one sided) was done over MPCE (URP, MRP, MMRP) for testing the poolability of Central and State sample data for urban and rural. Number of districts for which poolability was rejected by both the above mentioned tests is given below;

Table: 3.1
Number of Districts for which Poolability was rejected over MPCE
by run test using Z-statistics (one sided)

Type	Sector	
	Rural	Urban
URP	4	3
MRP	3	3
MMRP	6	2
Total Districts	33	34

In the above statement run test at 1% critical error the null hypothesis is rejected for 4, 3 and 6 districts in rural areas for URP, MRP and MMRP respectively and for 3, 3 and 2 districts in case of urban areas respectively.

Similarly number of districts for which poolability was rejected over LFPR by Chi-Square test is given below;

Table: 3.2
Number of Districts for which Poolability was rejected over LFPR by Chi-Square test

Type	Sector	
	Rural	Urban
PS + SS	11	00
CWS	13	01
CDS	15	04
Total Districts	33	34

Divergence between the estimates of Central and State sample:

Considering the district as domain of pooling, the divergence is worked out as absolute percentage difference between Central and State sample estimates. The distribution of districts by absolute percentage range of divergence of MPCE (Food, Non-food and total) of Central and State sample in Maharashtra for rural and urban sector and for MPCE (URP, MRP, MMRP) is given in table 3.3 to 3.5 below:

The districts with more than 20 percent divergence in total MPCE (URP) were 15 (45%) out of 33 districts in the rural sector and 12 (35%) out of 34 district in the urban sector. Similarly in total MPCE (MRP) it is 9 (27%) out of 33 districts in the rural sector and 10 (29%) out of 34 district in the urban sector. In case of MPCE (MMRP) it is 26 (79%) in the rural sector and 28 (82%) in the urban sector. The distribution of district by range of RSE of MPCE (URP, MRP, and MMRP) of Central and State sample for rural and urban sector is given in table 3.6 to table 3.11.

From the above tables which show the distribution of districts by RSE level, it can be seen that in case of URP the pooled estimates of MPCE on food, non-food and total have RSE less than 15% for all districts except for only one district in both rural and urban sector. Also in case of MRP the pooled estimates of MPCE on food, non-food and total have RSE less than 10% for all districts except for one or two districts in urban sector. In case of MMRP, RSE estimates of pooled sample of MPCE on food, nonfood and total MPCE are below 15% for rural and also urban sector.

Considering the district as domain of pooling, the divergence is worked out as absolute percentage difference between central and state sample estimates. The distribution of districts by absolute percentage range of divergence of WPR and LFPR (PS+SS, CWS, CDS) of central and state samples in Maharashtra for rural and urban sector is given in table: 3.12 below:

RSE of estimates of WPR and LFPR (PS+SS, CWS, CDS) were found to be within 15 % for central, state sample and pooled estimates in rural sector, whereas in urban sector, RSE of all districts was found to within 25% except one or two districts for central and state sample and within 20% except 2-3 districts for pooled sample.

Chapter – 4

Testing poolability and Methodology for pooling

1 Testing poolability of central and state sample

1.1 Though the central sample and state sample are drawn independently following identical sampling design with same concepts, definitions and instructions, the state sample unit level data in some cases are not properly validated. There is also expected agency bias in the two sets of data generated by different agencies. As such they cannot be merged for generating pooled estimate without testing that the samples are realized from identical distribution function. Since the parametric distribution of the sample mean is unknown one may adopt nonparametric tests such Run test, Median test, chi-square test etc to test that the samples are coming from identical distribution function.

1.2 Median test

1.2.1 In statistics, the median test is a special case of Pearson's Chi-square test. It tests the null hypothesis that the medians of the populations from which two samples are drawn, are identical. Observations in each sample are assigned to two groups, one consisting of data whose values are higher than the median value in the two groups combined, and the other consisting of data whose values are at the median or below. A Pearson's Chi-square test is then used to determine whether the observed frequencies in each group differ from expected frequencies derived from a distribution combining the two groups.

Let m^* be the median of the pooled sample data. Construct 2 X 2 contingency table as below and use chi-square test to test if State sample and Central sample have identical median.

Sample type	Number of sample observation		Total
	$\leq m^*$	$> m^*$	
State Sample	N_{11}	N_{12}	$N_{1.}$
Central Sample	N_{21}	N_{22}	$N_{2.}$
Total	$N_{.1}$	$N_{.2}$	$N_{..}$

Observed frequency of each cell $O_{ij} = N_{ij}$ where $i = 1$ to 2 , $j = 1$ to 2 .

Expected frequency of each cell $E_{ij} = (N_{i.} * N_{.j}) / N_{..}$ where $i = 1$ to 2 , $j = 1$ to 2 .

$$\chi^2 \text{ Value} = \sum_{i=1}^2 \sum_{j=1}^2 (O_{ij} - E_{ij})^2 / O_{ij} \text{ with degrees of freedom} = (2-1)*(2-1) = 1$$

The statistical power of this test may sometimes be improved by using a value other than the median to define the groups say quintile classes– that is, by using a value which divides the groups into more nearly equal groups than the median would.

1.3 Multinomial distribution test or χ^2 test

For discrete data such as status of activity, educational level and categorical variable such as land possessed etc, standard tests of equality of sample proportions of two sets of data based on multinomial distributions, relevant chi-square tests may be used after grouping the attributes/categorical variables into a suitable number of classes so that each class contains adequate number of sample observations. Construct 2 X k contingency table for k classes at the domain where two sets of data are to be pooled as below and use chi-square test if State sample and Central sample have identical distribution.

Sample type	Number of sample observation					Total
	Class - 1	Class - 2	...	Class - k-1	Class - k	
State Sample	N_{11}	N_{12}	...	N_{1k-1}	N_{1k}	$N_{1.}$
Central Sample	N_{21}	N_{22}	...	N_{2k-1}	N_{2k}	$N_{2.}$
Total	$N_{.1}$	$N_{.2}$...	$N_{.k-1}$	$N_{.k}$	$N_{..}$

Observed frequency of each cell $O_{ij} = N_{ij}$ where $i = 1$ to 2 , $j = 1$ to k .

Expected frequency of each cell $E_{ij} = (N_{i.} * N_{.j})/N_{..}$ where $i = 1$ to 2 , $j = 1$ to k .

$$\chi^2 \text{ Value} = \sum_{i=1}^2 \sum_{j=1}^k (O_{ij} - E_{ij})^2 / O_{ij} \text{ with degrees of freedom} = (2-1)*(k-1) = k-1$$

1.4 Wald-Wolfowitz run test

1.4.1 Suppose X and Y are independent random samples with cumulative distribution function (CDF) as $F_s(x)$ and $F_c(y)$. Null Hypothesis to be tested is $H_0: F_s(x) = F_c(x)$ for all x against alternative Hypothesis is $H_1: F_s(x) \leq F_c(x)$ for all x and $F_s(x) < F_c(x)$ for some x. Let x_1, x_2, \dots, x_m be iid observation from state sample with distributive function F_s and y_1, y_2, \dots, y_n be iid observation from central sample with distributive function F_c . Pool the data and order them with respect to comparable characteristic under consideration say monthly per capita expenditure (MPCE). In the pooled order sequence put "1" for X and "0" for Y. Let U be the total runs observed where 'run' is a sequence of adjacent equal symbols. For example, following sequence: 111100011100111110000 is divided in six runs, three of them are made out of "1" and the others are made out of "0". The number of runs U is a random variable whose distribution for large sample can be treated as normal with:

$$\text{mean} : \frac{2mn}{m+n} + 1$$

$$\text{variance} : \frac{2mn(2mn-m-n)}{(m+n)^2(m+n-1)}$$

After normalizing the variable U one may use one sided z-test for testing the Null hypothesis. In extreme case the value of U will be 2 meaning by observed characteristic of all the observation of one sample is less than the other samples.

1.4.2 One of the limitations of this test is when there is a tie between two samples in the observed value. One has to resolve ties in usual manner. However if there is large number of ties which is bound to occur specially for qualitative attributes like education level, activity status etc, this test is not recommended. This test can be well applied for a continuous variable such as MPCE which are less prone to ties. For discrete variable chi-square test is recommended.

2 Methodology for pooling

2.1 Pooling by inverse weight of the variance of the estimates

2.1.1 Aggregate estimate: For any characteristic, consider the state sample [s] in the form of two independent sub- sample s1 and s2 and the central sample [c] in the form of two independent sub-sample c1 and c2. Based on this, the respective estimates for state and central can be computed as:

$$t_s = \sum (ts1 + ts2)/2 \text{ and } t_c = \sum (tc1 + tc2)/2$$

Pooled estimate leading to optimum combination of these two estimates is given by weighing with inverse of the variance of the estimate. Thus the pooled estimate is given by:

$$T_p = \frac{V(t_c)t_s + V(t_s)t_c}{V(t_c) + V(t_s)} \quad \text{with} \quad V(T_p) = \frac{V(t_c)V(t_s)}{V(t_c) + V(t_s)}$$

In general and $V(t_c)$ and $V(t_s)$ are unknown and can be estimated as

$$\hat{V}(T_c) = \sum_l (t_{c1} - t_{c2})^2/4, \quad \hat{V}(T_s) = \sum_l (t_{s1} - t_{s2})^2/4$$

where \sum_l stands for summing over stratum x sub-stratum level variance at the domain of pooling.

Thus pooled estimate and estimate of pooled variance is given by

$$t_p = \frac{\hat{V}(t_c)t_s + \hat{V}(t_s)t_c}{\hat{V}(t_c) + \hat{V}(t_s)} \quad \hat{V}(t_p) = \frac{\hat{V}(t_c)\hat{V}(t_s)}{\hat{V}(t_c) + \hat{V}(t_s)}$$

2.1.2 By virtue of weighing the two estimates at the domain level at which two estimates are pooled, the pooled estimate will always lie between the central and state sample estimates.

2.1.3 Estimate of rate: Let Γ_c and Γ_s be the estimate of R_c and R_s ie Y/X based on central and state sample respectively with corresponding estimated mean square error $mse(\Gamma_c)$ and $mse(\Gamma_s)$. The pooled estimate and estimate of variance of pooled ratio estimate may be given by:

$$r_p = \frac{mse(r_c)r_s + mse(r_s)r_c}{mse(r_c) + mse(r_s)}, \quad mse(r_p) = \frac{mse(r_c)mse(r_s)}{mse(r_c) + mse(r_s)}$$

Where $mse(r_c)$ and $mse(r_s)$ are calculated using estimation procedure of NSS 66th round. Alternatively one can generate the pooled estimate of aggregate by inverse weight of estimate of variance obtained from central and state sample using formula given in para 2.1.1 for the characteristics x as well as y and obtain the pooled estimate of ratio as ratio of pooled estimate of aggregate. This will ensure consistency between pooled estimates of aggregate and the pooled estimate of ratio.

2.1.4 Method laid down in para 2.1.1 and 2.1.2 requires calculation of estimate of variance of the estimates before pooling them. Reliability of estimate of variance should be ascertained with due consideration of sample size. Besides the complex calculations of variances and covariances for each cell of the table, one needs to address the issue of non-additivity of the component estimates with the estimate of marginal total. For e.g. pooled estimate of MPCE of FOOD and NON-FOOD may not add up to MPCE of TOTAL. To obviate this problem one may generate the pooled estimates of components first and then derive the estimate of total as sum of estimates of components.

2.2 Pooling by simple average of the estimates

2.2.1 Many of the States are not fully equipped with complex calculation of estimate of variance especially when cells of the table contains ratio of two characteristics which is usually presented in the NSS reports. When the State's participation is equal matching of central samples, the simple average of two estimates may be a way of combining the estimates considering central and state samples as independent samples. The pooled estimate will always lie between the estimates based on central and state sample separately.

2.2.2 When the State's participation is of unequal matching of central samples, the weighted average of two estimates with weights being matching ratio of central and state sample may be a better way of combining the estimates considering central and state samples as independent samples. For any characteristic, consider the state sample [s] in the form of two independent sub-sample s1 and s2 and the central sample[c] in the form of two independent subsample c1 and c2. Let matching ratio of state and central sample be m : n. Based on this, the respective estimates for state and central can be computed as:

$$t_s = \sum_l (t_{s1} + t_{s2})/2 \quad \text{and} \quad t_c = \sum_l (t_{c1} + t_{c2})/2$$

Pooled estimate of these two estimates is given by weighing with matching participation rate m:n. Thus the pooled estimate is given by:

$$t_p = \frac{mt_s + nt_c}{m+n} \quad \text{with} \quad V(t_p) = \frac{m^2V(t_s) + n^2V(t_c)}{(m+n)}$$

In general $V(t_s)$ and $V(t_c)$ can be estimated as $\hat{V}(t_c) = \sum_l (t_{c1} - t_{c2})^2/4$,

$$\hat{V}(t_s) = \sum_l (t_{s1} - t_{s2})^2/4 \quad \text{and thus} \quad \hat{V}(t_p) = \frac{m^2\hat{V}(t_s) + n^2\hat{V}(t_c)}{(m+n)^2}$$

The pooled estimate will always lie between the estimates based on central and state sample separately.

2.3 Summing up: For those characteristics which are known to be distributed as Normal, poolability of the two sets of central and state data may be tested by standard parametric tests such as Z-test. For those characteristics for which transformation makes them Normal, such methodology may be adopted. In most of the situations where the distribution is non-normal and unknown, the two sets of data may be tested through various non-parametric tests such as those laid down in para 1 of above. For discrete data, Standard tests of equality of proportions based on binomial distribution may be used and for multinomial distributions relevant chi-square tests may be used.
